

## S03-L07

Using two indexes for the  
same table in one query

## S03-L07 Using two indexes for the same table

You can use UNION - in some simple queries the engine chooses it automatically.

```
SELECT
  employee.id,
  employee.personal_code
FROM employee
WHERE (
  employee.personal_code = '7C-91159'
  OR
  id BETWEEN 12340 AND 12400
)
```
